

Solana SPL Token Setup – Technical Walkthrough

Overview

This document demonstrates a complete setup of a Solana SPL token on devnet, including secure configuration and supply finalization.

1. Implementation Summary

The following steps were performed:

- Created SPL token on Solana devnet
- Minted fixed supply
- Revoked mint authority
- Disabled freeze authority

This ensures that the token supply is immutable and cannot be altered after deployment.

2. Result

Final State:

- Supply: **1,000,000 tokens**
- Decimals: **9**
- Mint Authority: **Disabled**
- Freeze Authority: **Disabled**

🔒 The token is fully immutable — no additional tokens can be minted.

3. Execution Proof

(Insert terminal screenshot here)

Caption:

Token is immutable (no further minting possible)

4. Commands Used

```
spl-token create-token --decimals 9
spl-token create-account Ad13m8CkKucDVDVj6DUAtcofR7JhfqxBcY4YCwwnaaca
spl-token mint Ad13m8CkKucDVDVj6DUAtcofR7JhfqxBcY4YCwwnaaca 1000000
spl-token authorize Ad13m8CkKucDVDVj6DUAtcofR7JhfqxBcY4YCwwnaaca mint --disable
spl-token display Ad13m8CkKucDVDVj6DUAtcofR7JhfqxBcY4YCwwnaaca
```

5. Why This Matters

This setup guarantees:

- Deterministic token supply
- No risk of hidden inflation
- Trustless verification on-chain
- Clean and transparent token launch

🔑 Clients receive a production-ready token configuration aligned with best practices.

Alternative (Minimal Version)

Solana Token Setup Example

- Token created using SPL Token Program
- Supply: 1,000,000
- Decimals: 9
- Mint authority revoked
- Freeze authority disabled

This ensures a fixed and immutable supply.
