Lockrion

Predictable yield in DeFi

DeFi rewards are broken

- You don’t know your return
- You can’t evaluate risk
- Incentives are unpredictable

Deterministic finance

- Fixed reward pools
- Know your outcome in advance
- Fully on-chain logic

How it works

- Fixed reward pool is created
- Users deposit into the pool
- Rewards are calculated deterministically
- Users know the outcome before they deposit

Production-grade protocol

- Smart contract on Solana
- Deterministic reward engine
- 40+ tests covering all flows
- Working frontend + live demo

Live demo available

Target users:

- DeFi protocols
- DAOs
- Token issuers

Business Model

- Protocols launch predictable yield pools
- Platform takes a fee per issuance
- Scalable infrastructure for reward distribution

Why me

- Built full system end-to-end (contract + frontend)
- Deep focus on deterministic models
- Already working MVP
- Built independently end-to-end

Why now

- DeFi needs predictable yield
- Risk transparency is critical
- Current models are unstable
- Users need to know what they will earn

Lockrion

Deterministic

Transparent

Scalable
